

SUPPLEMENTARY MATERIAL

Evolution of shallow post-bog soils developed on Holocene carbonate sediments in NW Poland

Grzegorz Jarnuszewski  , Edward Meller , Teodor Kitzak 

West Pomeranian University of Technology, Department of Environmental Management, Juliusza Słowackiego St, 17,
71-434 Szczecin

Table S1. Some chemical properties of organogenic layers of post-bog soils on Holocene carbonate limnic deposits in NW Poland

Type of soil	Average thickness of surface horizon / horizon symbol / material / pH 1M KCl range	Statistics	Share of basic components			Organic carbon	General forms of elements						Exchangeable bases of elements				Sum of exchangeable bases		
			LOI	CaCO ₃	Ncf	C _{org}	N _{tot}	S	P	Ca	Mg	K	Na	CaEB	KEB	MgEB	NaEB		
			%			g·kg ⁻¹ s.m.						cmol ⁽⁺⁾ ·kg ⁻¹							
			test																
			T	H	H	H	H	W	T	T	H	H	W	H	T	W	WT	H

		<i>g</i>	a	b	ab	a	a		a	b	b	a		ab	a			a	

Explanations: *x* = average, *SD* = standard deviation, *g* = different letters show the significant differences between each sample groups at $p < 0.05$ in statistical tests: Tukey's and Kruskal-Wallis, for the Welch test groups are not distinguished, *LOI* = losses on ignition, *Ncf* = mineral non-calcium fraction, T = Tukey's test for unequal sample sizes, H = Kruskal-Wallis test, W = Welch test, WT = without test.
